

Examples

Q1- Write an 8051 C program to toggle all the bits of P0 and P2 continuously with a certain delay. Assign the value of 0x55H to P0 and P2 firstly.

Q2- Write a C program to monitor the P2.7 bit. When it is low, send 63H and 2AH to P0 continuously.

Q3- Write an 8051 C program to get bit P1.0 and send it to P2.7 after inverting it. (Use inverting sign ~)

Q4- Show the design of an 8031-based system with 8K bytes of data ROM an 8K bytes of data RAM, and 8K of program ROM. The data ROM starts from address 2000H while data RAM starts from address 6000H.

Q5- Show the design of an 8031-based system with 8K bytes of data ROM an 8K bytes of data RAM, and 8K of program ROM. The data ROM starts from address 0000H while data RAM starts from address A000H.

Q6- Show the design of an 8031-based system with memories and their assigned addresses as appeared in the following tables. The capacity of each memory is 4K Bytes.

Memory	Starting address
Data RAM	3000H
Data RAM	7000H
Data ROM	D000H
Program ROM	-
